

What should I do in the event of a fire?

- » Keep calm!
- » In thick smoke, move around as close to the ground as possible.
- » Exit the apartment immediately together with all other people. **Beware!** Never escape via a smoke-filled stairwell, because inhaling just a few breaths of smoke will result in loss of consciousness and subsequent death.
- » Help elderly, disabled and sick fellow residents without putting yourself at risk.
- » Keep doors and windows to burning rooms closed to prevent the spread of fire and smoke.
- » Do not use lifts.
- » Alert other residents.
- » **Notify the fire brigade by dialling 112.**

Important information for the fire brigade:

- » **Who are you (name, phone, etc.) ?**
- » **Where is the fire (address) ?**
- » **What has happened (extent of the fire) ?**
- » **What is the situation (injuries etc.) ?**
- » **Await instructions from the fire brigade.**

We make Germany safe.

Apartment fires with fatalities or dramatic cases of legionnaires' disease. Time and again, we are shocked by such news in the media – and time and again following such incidents, there are loud calls for greater protection of the population.

The political world responds to an extent with mandatory smoke detector installation in rented apartments and compulsory legionella checks for large hot-water tanks. As a leading provider of services relating to the testing of drinking water and the installation and maintenance of smoke detectors, we are working on staying one step ahead of the dangers in the German residential environment every day.

kaloPRIMUS i

**'The right smoke detector for
your safety –
we take care of it personally.'**

Mike Plambeck,
KALO Technical Inspection

To protect your life

kaloPRIMUS i smoke detectors, a high-quality product manufactured in Europe, are installed in the rooms you inhabit.

This installation serves to protect your life and your health.

The installed devices provide an early and reliable warning in the event of smouldering and open fires producing smoke. They therefore buy you vital time, allowing you and all those in your property to reach safety, call the fire brigade by dialling 112 and/or take appropriate measures to extinguish the fire.

A sophisticated device with comfort features

The sophisticated kaloPRIMUS i constantly checks whether there is smoke in the detector by means of an optical sensor. If a fire is detected, it signals this with a loud audible alarm and a flashing red light.

In normal operating mode, there are no audible or visible fault indicators. Since smoke is detected by optical means, there is no dangerous radiation emitted from the device.

Secure installation – the basis of your protection

The smoke detectors are carefully installed by KALO according to the mandatory application standard DIN 14676. Smoke detectors therefore should not be removed from their original installation site and installed elsewhere. Painting, wallpapering over or covering the kaloPRIMUS i will result in faults or even failure of the device. As a fundamental rule, the kaloPRIMUS i must only be exposed to levels of dirt normal for conventional use of a domestic property.

Smoke detectors do not extinguish fires, they are merely able to raise an alarm. Should the kaloPRIMUS i be damaged, please call the service number on the back immediately. In the event of any changes to your accommodation (e.g. from a study to a nursery) please inform your property management company or your landlord.

Annual maintenance

The kaloPRIMUS i is equipped with a soldered-in high-performance lithium battery, which means that there is no need to change the battery at any point in the life of the smoke detector. However, annual maintenance is required in accordance with DIN 14676, which is diligently carried out for you by KALO (in conjunction with reading heat cost allocators wherever possible). Among other things, the smoke detector is checked to ensure it is working correctly and is still located in the correct position, and the maintenance work is documented with a meter reading document.

What should I do if the smoke detector emits an alarm signal?

Keep calm. If the alarm sounds continuously, first check your property to see if you can find a fire. If there is no fire visible, you can mute the alarm by pressing the large button (can be activated with a broom handle, for example). The mute function suppresses the alarm for approximately ten minutes.

Ventilate the room well and check to make sure there is no steam, cooking vapour or other non-hazardous source of smoke. Once the possible cause has been eliminated by ventilating the property, the smoke detector returns to normal operation after the mute period has elapsed.

If the detector continues to emit optical and acoustic alarm signals, there is a fault.

If the mute switch is pressed **THREE** times, the alarm is suppressed for eight hours. During this time, a warning signal sounds every ten minutes, indicating a fault. The device is not fit for use and must be replaced. Call the service number on the back during this period.
